

# Axial Piston Fixed Motor HAA2FM

Series: 61/69

Size: 45–90 mL/r

Rated pressure: 30 MPa

Max. pressure: 35 MPa

Series: 63

Size: 45–90 mL/r

Rated pressure: 40 MPa

Max. pressure: 45 MPa

Series: 10

Size: 80–107 mL/r

Rated pressure: 30 MPa

Max. pressure: 35 MPa

## Features

- Axial piston motor of bent-axis design for hydrostatic drives in open and closed circuits
- The output speed results from pump flow and motor displacement
- The output torque increases with the pressure differential between the high- and low-pressure sides and with increasing displacement
- High power to weight ratio
- Integrated piston design with piston ring makes it compact in structure
- High starting torque efficiency and high total efficiency

## ➤ Structure

## ► Hydraulic Fluid

Mineral oil

## ► Working Viscosity

In order for the optimum efficiency and service life, it is recommended to select the working viscosity (at working temperature) within the range below:

$$V_{opt} = \text{optimal working viscosity } 16\ldots36 \text{ mm}^2/\text{s}$$

It is subject to the circuit temperature of a closed circuit and the reservoir temperature of an open circuit.

## ► Limit Viscosity

Limit viscosity:

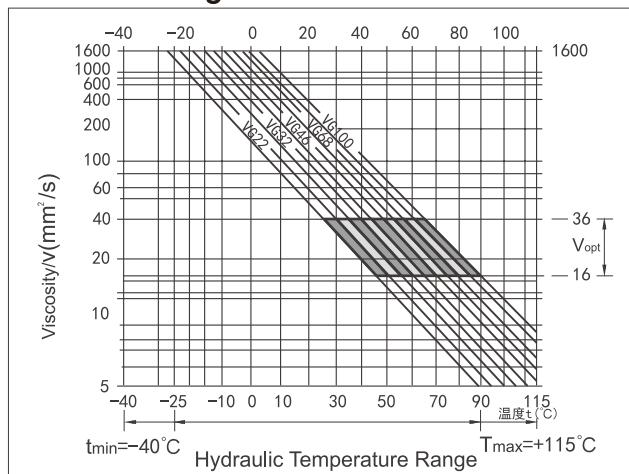

$$V_{min}=5 \text{ mm}^2/\text{s}$$

Short-term operation, permissible maximum temperature  $t_{max}=+115^\circ\text{C}$

$$V_{max}=1600 \text{ mm}^2/\text{s}$$

Short-term operation, cold start ( $t_{min}=-40^\circ\text{C}$ )

## ► Selection Diagram

## ► Instructions on Selection of Hydraulic Fluid

The working temperature dependent on the ambient temperature is required for correct selection of hydraulic fluid. It refers to the circuit temperature of a closed circuit and the reservoir temperature of an open circuit.

The hydraulic fluid should be so selected that the working viscosity in the working range is within the optimum range ( $V_{opt}$ , the shaded area on the selection diagram). The higher viscosity is recommended under the same conditions.

For example:

At an ambient temperature of  $X^\circ\text{C}$ , the working temperature of the circuit is  $60^\circ\text{C}$ . The viscosity within the optimum range ( $V_{opt}$ , shaded area) is VG46 or VG68 and the latter should be selected.

Note: The leakage (case drain) temperature depends on the pressure and motor speed, and it is always higher than the circuit or reservoir temperature.

## ► Filtration

Finer filtration improves the cleanliness level of the hydraulic fluid, thus increasing the service life of the axial piston unit. To ensure normal operation of the axial piston unit, a cleanliness level of at least 9 according to NAS 1638 or 18/15 according to ISO/DIS 4406 is to be maintained.

When the hydraulic fluid has a high temperature, the cleanliness level should at least reach 8 according to NAS 1638 or 17/14 according to ISO/DIS 4406.

## ► Working Pressure Range

Max. pressure at working port A or B

Size	Drive shaft	Nominal Pressure P <sub>N</sub>	Max. Pressure P <sub>max</sub>
56/63	S	35MPa	40MPa
	T	40MPa	45MPa
80/90	T	40MPa	45MPa
	S	30MPa	30MPa

## ► Flow Direction

CW rotation \_\_\_\_\_ A to B  
CCW rotation \_\_\_\_\_ B to A

## ► Speed Range

No limit to minimum speed  $n_{min}$ . If uniformity of motion is required,  $n_{min}$  must not be less than 50 rpm.

See the operating parameters for the maximum speed.

## ► Shaft Seal

Permissible pressure load

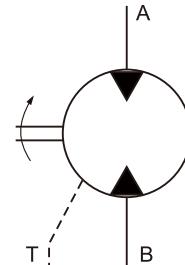

The motor speed and case drain pressure affect the service life of the shaft seal. The permissible case drain pressure for intermittent operation depends on motor speed.

For short-term operation ( $t < 5$  min), the permissible absolute pressure peak may reach 1 MPa. The case pressure must be equal to or higher than the external pressure of the shaft seal.

## ► Symbols

Port connection

A/B \_\_\_\_\_ working port  
T \_\_\_\_\_ drain port

## ➤ Technical Data

Size			Unit	45	56	63	80	90	107

Equivalent torque Torque at		$T_k$	Nm/MPa	7.25	8.9	10.0	12.7	17.0	19.9
	$\Delta p=35$ MPa	T	Nm	254	312	350	445	501	595
	$\Delta p=40$ MPa	T	Nm	290	356	400	508	572	680
Case volume			L	0.33	0.45	0.45	0.55	0.55	0.8
Moment of inertia of drive shaft		J	$\text{kgm}^2$	0.0024	0.0042	0.0042	0.0072	0.0072	0.0116
Weight		M	kg	13.5	18	18	23	23	32

(1) : Intermittent maximum speed: overspeed for unloading and overhauling processing,  $t < 5$  s and  $\Delta p < 15$  MPa

## ➤ Specification Calculation

Input flow	$q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$	[L/min]
Torque	$T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$	[Nm]
Power	$P = \frac{2\pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$	[KW]

$V_g$  = Displacement per revolution, mL/r  
 $\Delta p$  = Differential pressure, MPa  
 $n$  = Speed, rpm  
 $\eta_v$  = Volumetric efficiency  
 $\eta_{mh}$  = Mechanical-hydraulic efficiency  
 $\eta_t$  = Total efficiency

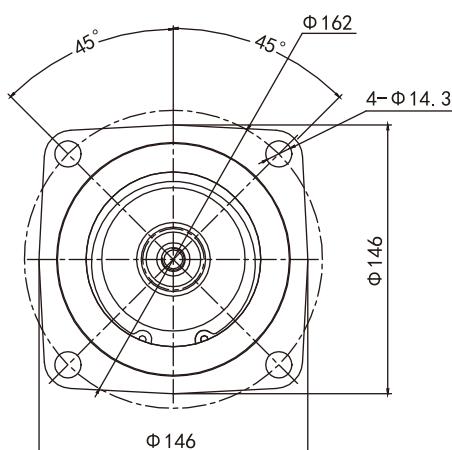

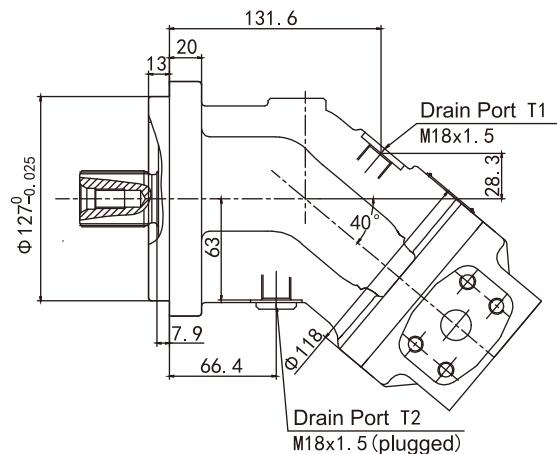

## ➤ Minimum Inlet Pressure at Port A(B)

A minimum inlet pressure must be ensured at the fluid inlet to avoid damaging the motor.

The minimum inlet pressure is related to motor speed.

## ➤ Flushing and Boost-pressure Valve

### Overview

The flushing valve is used to prevent over-temperature. The minimum boost pressure must be guaranteed for flushing of a closed circuit. Hydraulic fluid from the low-pressure side is directed into the motor housing. Then, it is fed into the reservoir together with the case drain. The removed hydraulic fluid must be made up by the boost-pressure valve.

Cracking pressure (1.6 MPa, fixed setting) of the boost-pressure valve must be considered when setting the boost pressure of the pump in a closed circuit.

### Standard flow

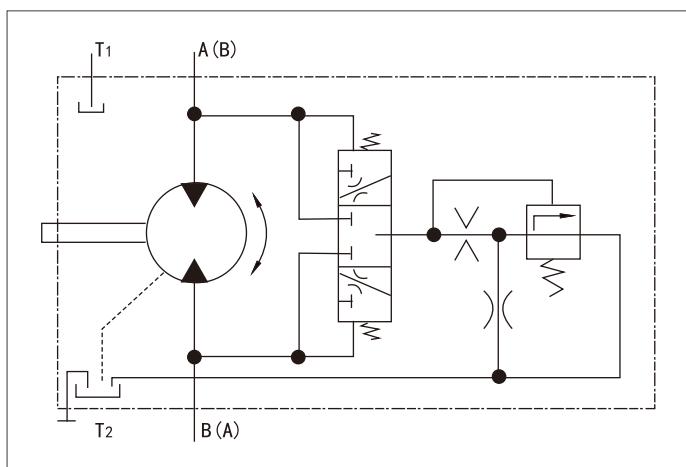

At low pressure  $\Delta p = 2.5 \text{ MPa}$

Size	Flushing Flow
45/56/63	3.5 L/min
80/90	5 L/min
107	8 L/min

Orifices can be used to adjust the flow as necessary and throttle valves of 3.5-10 L/min are available.

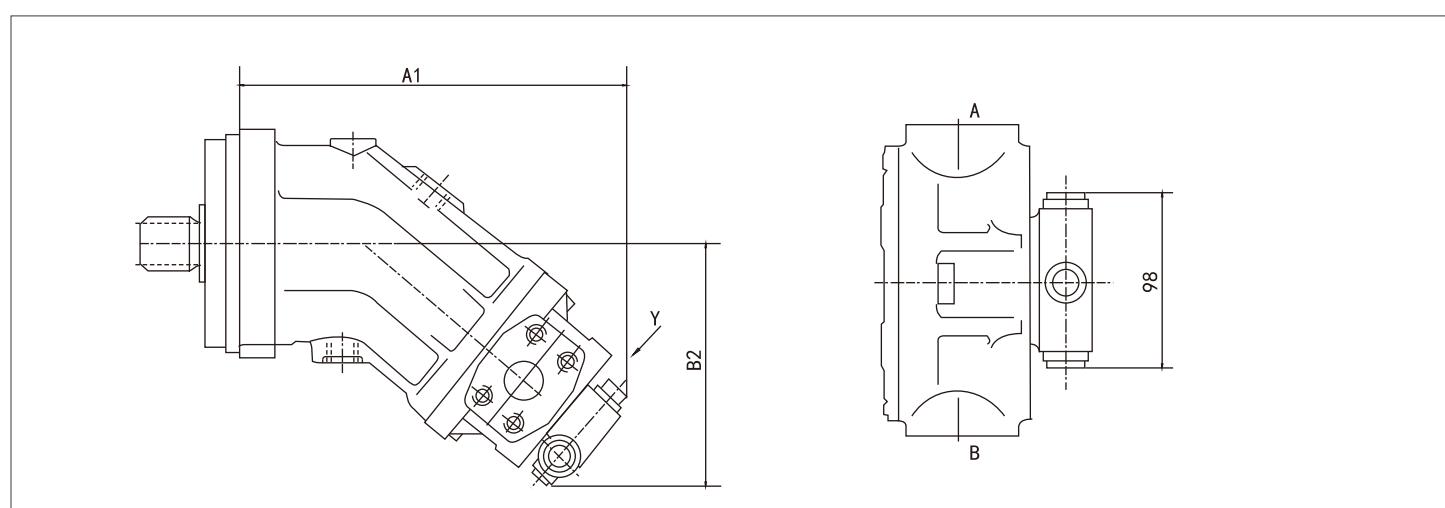

If nonstandard flows are required, please specify the required throttle valve when ordering.
