

Internal Gear Pump HG

HG series internal gear pumps manifesting the high efficiency and low energy consumption of servo VFD systems are widely used on such industrial machinery as plastics machinery, shoe machinery, diecasting machinery and forklift. It is particularly suitable for the energy saving system of servo VFDs. It is designed and developed to meet high pressure and high speed requirements of servo VFDs. The internal oil passages are further optimized based on suction and discharge flow analysis in high-speed high-pressure working conditions, and the dynamic stability of the pressure compensation mechanism is improved to enhance reliability of the products.

Displacement: 8-180 ml/r
Max. pressure: 350 bar
Max. speed: 3000 r/min
Min. speed: 200 r/min

Features

- Axial and radial pressure compensation is designed to keep high volume efficiency even at low speed and low viscosity
- Suitable for such operations as 1/2-quadrant, pressure holding and start/stop
- High-strength cast iron and unique inner noise reduction design for lower noise
- Extremely low flow and pressure fluctuation so that stable flow and pressure output can be kept even at low speed
- Insensitive to oil contamination & long life
- Through-drive available

Structure

HG series hydraulic pumps are internal gear pumps with fixed displacement and clearance compensation.

Basic structure: 1- front body; 2- middle housing; 3- rear cover; 4- shaft bearing; 5- annular gear; 6- sliding bearing; 7- front and rear side plates; 8- locating rod; 9- crescent side plate; 10- crescent main plate; 11- plastic rod

Technical Data

Design	Internal gear pump with clearance compensation
Type of connection	2-hole flange SAE J744
Pipe connection	Flange connection
Shaft load	Only radial and axial forces obtained through consultation (e.g. on beltpulley)
Rotation direction (from shaft end)	CW and CCW (as required) - not upside down
Hydraulic fluid	Petroleum base mineral oil with viscosity within the range of 10-300 mm ² /s; ISO VG46 anti-wear hydraulic oil is recommended
Temperature range	Working temperature range: -10 °C-100 °C; to ensure long-term reliable operation, the optimal working temperature range is 20 °C-80 °C.
Cleanliness control	Oil cleanliness of the control system should not exceed code 9 (NAS 1638) or 17/14 (ISO 4066).
Suction port pressure	Allowable absolute pressure at suction inlet: 0.8-2 bar

> HG Series Double Pump

HG00/HG10/HG11/HG21/HG22 Series

A double pump is a combination of two single pumps which are connected in series and have one shared input port and two output ports connecting two separate loops. The combination of different pump series can realize different displacements.

HG21	Φ 76	M16, 25 deep	106. 4	61. 9
HG22	Φ 89		120. 7	69. 9

> Installation Instructions

1. Drive Mechanism

Motor + Bell guard + Coupling + Pump

- The pump is not allowed to apply axial and radial forces on the drive shaft!
- The axes of the motor and the pump must be properly aligned!
- Always use a coupling that can realize compensation for shaft misalignment!
- Avoid axial force and the use of knocking tools when installing the coupling!
- Gently knock on the soft pad based on the fit tolerance of coupling!

2. Installation

3. Preparations

- Check whether the equipment is installed in a careful and clean manner.
- Use only the filter with the required minimum filter rating for oil filling.
- Fill the pump with oil through the suction line or pressure line.
- Check consistency of motor direction with pump direction based on the pump model.

4. Air Bleeding

- Manually open the air vent on the equipment or turn on zero-pressure circulation according to user manual of the equipment.
- Make sure the trapped air is discharged under no pressure in the venting process.
- Shortly start and promptly stop (inching) the motor to discharge air in the pump. Repeat this process until air in the pump is completely discharged.
 - Close the manually opened air vent.

➤ Installation Instructions

5.Put to Use

- Start the motor after confirming air in the pump is completely discharged.
- Run the pump under no pressure until air in the equipment is thoroughly discharged. Please observe the equipment user manual for venting.
- Put the equipment in use and load the pump according to the equipment user manual.
 - Check liquid in the oil tank for bubbles or foam on the surface after operation for a certain period of time.

6.Operation

- Pay attention to change in noise during operation. Minor increase of noise is normal due to temperature rise of the working medium. Significant noise increase or temporary severe noise fluctuations may be the symptom of intake of air. Air may be sucked with whirlpool caused by short suction pipe or low filling height of working medium.
- Speed change, temperature change, intensified noise and change in power consumption all indicate wear or damage of the equipment or pump.

7.Operation after Servicing

- Check air tightness of the pump and the equipment, Leakage indicates poor tightness below the liquid.
- Rise in liquid level of the oil tank indicates poor tightness above the liquid.
- The pump may idle due to poor tightness incurred by worn shaft seal or other factors when the pump is installed above the pressure liquid. In this case, air discharge is required for repair before it is put in use again.
- Make sure to discharge the air after repair and maintenance.
- Start the motor on condition that the equipment is in good condition.

Important Tips

- Only authorized, properly educated and trained personnel are allowed to carry out pump installation and maintenance!
- Use only allowable data for running the pump!
- Use only the pump in good condition!
- Make sure to turn the equipment to zero pressure mode before any work on the pump!
- Do not remove existing safety devices when installing additional ones (such as coupling protection)!
- Always check whether all fixing bolts are properly fastened (note the specified tightening torque)!
- Make sure to observe the universal and valid safety and accident prevention regulations!

! Recommended fit tolerance for coupling hole: H7
(to be made by experienced manufacturer to standard tolerance for minor interference fit)

Since 2002

Over twenty years of deep cultivation in the field of hydraulic Solutions

HYTEK is a high technology enterprise integrating R&D, production, sales and service of hydraulic power products. Provides professional hydraulic transmission control products and solutions for construction machinery, road machinery, material handling machinery, agricultural and forestry machinery, industrial equipment and other fields. After more than 20 years of continuous R&D, technological innovation, market development and application services, technical level and the scale of production and sales have been on the forefront of the industry. Hytek has been committed to helping the development of subdivided industries with innovative hydraulic technology, "focusing on the challenges and pressures of customers, providing competitive products and solutions, reducing costs and increasing efficiency for customers, and continuously creating maximum value".

Product Series

- Open Circuit Pump
- Closed Circuit Pump
- Fixed Displacement Motor
- Variable Displacement Motor
- Hydrostatic Transmission Unit
- Internal Gear Pump
- Vane Pump
- Proportional valve/
Industrial Hydraulic Valve
