

Axial Piston Fixed Motor HA2FM/E Series 61/69/63

Series:61/69
Displacement:23-180 mL/r
Rated Pressyre:30 MPa
Max.Pressyre:35 MPa

Series:63
Displacement:23-160 mL/r
Rated Pressyre:40 MPa
Max.Pressyre:45 MPa

Features

- Axial piston motor of bent-axis design for hydrostatic drives in open and closed circuits
- The output speed is directly proportional to the input flow and inversely proportional to the displacement
- The output torque increases with the pressure differential between the high- and low-pressure sides
- Tapered piston with sealed piston ring
- Pressure relief valve for protection of hydrostatic drives against overload
- Compact design and high total efficiency

Structure

HA2FM

HA2FE

➤ Hydraulic Fluid

Mineral oil

➤ Working Viscosity

In order for the optimum efficiency and service life, it is recommended to select the working viscosity (at working temperature) within the range below:

V_{opt} = optimal working viscosity 16...36 mm²/s

It is subject to the circuit temperature of a closed circuit and the reservoir temperature of an open circuit.

➤ Limit Viscosity

Limit viscosity:

V_{min} = 5 mm²/s

Short-term operation, permissible maximum temperature t_{max} = +115 °C

V_{max} = 1600 mm²/s

Short-term operation, cold start (t_{min} = -40 °C)

➤ Selection Diagram

➤ Instructions on Selection of Hydraulic Fluid

The working temperature dependent on the ambient temperature is required for correct selection of hydraulic fluid. It refers to the circuit temperature of a closed circuit and the reservoir temperature of an open circuit.

The hydraulic fluid should be so selected that the working viscosity in the working range is within the optimum range (V_{opt} , the shaded area on the selection diagram). The higher viscosity is recommended under the same conditions.

For example: At an ambient temperature of X °C, the working temperature of the circuit is 60 °C. The viscosity within the optimum range (V_{opt} , shaded area) is VG46 or VG68 and the latter should be selected.

Note: The case drain temperature depends on the pressure and speed, and it is always higher than the circuit temperature. The temperature at any point within the system should not exceed +115 °C.

➤ Filtration

Finer filtration improves the cleanliness level of the hydraulic fluid, thus increasing the service life of the axial piston unit. To ensure normal operation of the axial piston unit, a cleanliness level of at least 9 according to NAS 1638 or 18/15 according to ISO/DIS 4406 is to be maintained.

When the hydraulic fluid has a high temperature, the cleanliness level should at least reach 8 according to NAS 1638 or 17/14 according to ISO/DIS 4406.

➤ Working Pressure Range

Maximum pressure at working port A or B:

	Shaft End A/Z	Shaft End B/P
Nominal pressure P_N	40MPa	35MPa
Maximum pressure P_{max}	45MPa	40MPa

➤ Flow Direction

CW rotation _____ A to B
CCW rotation _____ B to A

➤ Speed Range

No limit to minimum speed n_{min} .

If uniformity of motion is required, n_{min} must not be less than 50 rpm.

See the operating parameters for the maximum speed.

➤ Case Drain Pressure

FKM shaft seal

The lower the speed and case drain pressure are, the longer the service life of the shaft seal is. The figure shows the permissible limit values of the shaft seal at intermittent pressure load. Do not exceed the values. Constant pressure within the case drain pressure limit will reduce life of the shaft seal.

1) : Intermittent maximum speed: overspeed for unloading and overhauling processing, $t < 5\text{s}$ and $\Delta p < 15\text{MPa}$

Specification Calculation

Input flow	$q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$	[L/min]	V_g = Displacement per revolution, mL/r
Torque	$T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$	[Nm]	Δp = Differential pressure, MPa
Power	$P = \frac{2\pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$	[KW]	n = Speed, rpm
			η_v = Volumetric efficiency
			η_{mh} = Mechanical-hydraulic efficiency
			η_t = Total efficiency

Flushing and Boost-pressure Valve

Overview

The flushing valve is used to prevent over-temperature. The minimum boost pressure must be guaranteed for flushing of a closed circuit.

Hydraulic fluid from the low-pressure side is directed into the motor housing. Then, it is fed into the reservoir together with the case drain fluid. The hydraulic fluid removed out of the circuit must be replaced by that from the boost-pressure valve.

Cracking pressure (1.6 MPa, fixed setting) of the boost-pressure valve must be considered when setting the boost pressure of the pump in a closed circuit.

Standard flow

At low pressure $\Delta p=2.5\text{MPa}$

Size	Flushing Flow
23/28/32/45/56/63	3. 5L/min
80/90	5L/min
107/125	8L/min
160/180	10L/min

Orifices can be used to adjust the flow as necessary. If nonstandard flows are required, please specify the required throttle valve when ordering.

Pressure Relief Valve

Overview

The pressure relief valve prevents overload of the hydraulic motor. Once it reaches the set cracking pressure, the hydraulic fluid flows from the high-pressure side to the low-pressure side. The pressure relief valve can only be used in combination with port plates 181 and 191. (The counterbalance valve is to be installed to the port plate 181. See the page below.)

Setting range of cracking pressure_____50-420 bar
Please specify in plain text the cracking pressure of the pressure relief valve when ordering.

Circuit diagram

Make sure to ask for the installation diagram before completion of the final design.Dimensions in mm.

➤ Counterbalance Valve BVD

Function

Counterbalance valves for travel drives/winches are designed to reduce the danger of overspeed and cavitation of axial piston motors in open circuits. Cavitation occurs if, during brake, when going downhill or during load lowering process, the motor speed is greater than that at the given inlet flow.
If the inlet pressure falls, the counterbalance spool moves to throttle the return flow and brake the motor until the inlet pressure returns to approx 20 bar.

Note

- The counterbalance valve cannot replace the mechanical service brake and holding brake.
- For the design of the brake release device, we must know the following data for the mechanical holding brake:
 - The cracking pressure
 - The volume of the counterbalance spool between the minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - The required closing time for warming up (oil viscosity at approx 15 mm²/s)

²⁾ : Depending on the application, momentary pressure peaks may occur. Keep this in mind when selecting measuring devices and fittings.

³⁾ : The countersink may be deeper than specified in the standard.

⁴⁾ : O=must be connected (plugged on delivery) X=plugged (in normal operation)

> Counterbalance Valve BVD

Mounting the counterbalance valve

The counterbalance valve is fastened to the motor with two set screws (transport lock) on delivery. The set screws may not be removed when mounting the working lines. If the counterbalance valve and the motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate with the supplied set screws. The counterbalance valve is finally mounted to the motor by fitting the SAE flange.

6 Screws(1,2,3,4,5,8) Length B1+B2+B3
2 Screws(6,7) Length B3+B4

Screw	Strength Grade	Tightening Torque(Nm)
M6*1 (set screw)	10. 9	15. 5
M10	10. 9	75
M12	10. 9	130
M14	10. 9	205

Tighten the screws in turn (from 1 to 8) in two steps (see the diagram on the right).
Step 1: Tighten the screws to a half of the tightening torque.
Step 2: Tighten the screws to the maximum tightening torque (see the table below).

1) : Minimum required threads:1*Φthread
2) : Sandwich plate valve included

➤ Installation and Commissioning Instructions-HA2FM

Installation of counterbalance valve

The motor must be filled with hydraulic fluid during startup and commissioning. The motor should be started at low speed under no load until air in the system is thoroughly bled.

The hydraulic fluid in the housing leaks through the working lines after a longer standstill.

Therefore, make sure the housing is filled with hydraulic fluid before restart. The leakage should be directed to the reservoir via the highest drain port of the housing.

Installation position

Any position you prefer. For installation position "drive shaft upwards", use motor with air bleed port R.

Above-reservoir installation

Above-reservoir installation means that the motor is installed above the minimum fluid level of the reservoir.

–The procedure is the same as that for below-reservoir installation.

–Installation positions 1 and 2:

The hydraulic fluid in the housing may leak via the working lines and air may come inside (through the shaft seal) in the case of a longer standstill. The bearings may not be properly lubricated at restart. Hence, hydraulic fluid must be filled via the highest drain port before restart.

–Installation position 2 (drive shaft upwards)

The bearings are not sufficiently lubricated in this position as long as the housing is not filled with hydraulic fluid. Insert a check valve (0.05 MPa cracking pressure) in the drain line to prevent overflow of hydraulic fluid from the drain port.

Below-reservoir installation

The motor is installed below the minimum fluid level of the reservoir. (standard)

–Fill the axial piston motor with hydraulic fluid via the highest drain port before startup.

–For the shaft upwards installation position, make sure to fully fill the motor housing before startup. Air bubbles at bearings will cause damage to the axial piston unit.

–Run the motor at low speed (initial speed) until the entire circuit is filled with hydraulic fluid.

–Minimum immersion depth of suction line and drain line in reservoir: 200 mm (from the minimum fluid level of the reservoir).

> Installation and Commissioning Instructions-HA2FE

Overview

The motor (housing) must be filled with hydraulic fluid during startup and commissioning.

The motor should be started at low speed under no load until air in the system is thoroughly bled.

The hydraulic fluid in the housing leaks through the working lines after a longer standstill. Make sure the housing is filled with hydraulic fluid before restart.

The leakage should be directed to the reservoir via the highest drain port of the housing.

Installation position

Shaft horizontal or vertically downward.

Top installation

The motor is installed below the minimum fluid level of the reservoir. (standard)

-Fill the axial piston motor with hydraulic fluid via the highest drain port before startup.

-Run the motor at low speed until the entire circuit is filled with hydraulic fluid. (Bleed the air via working ports A and B if the lines are long).

-Minimum immersion depth of drain line in reservoir: 200 mm (from the minimum fluid level of the reservoir).

Bottom installation

The motor is installed above the minimum fluid level of the reservoir.

-The procedure is the same as that for top installation.

-Additional measures for installation position 1:

The hydraulic fluid in the housing may leak via the working lines (and air may come inside through the shaft seal) in the case of a longer standstill.

The bearings may not be properly lubricated at restart. Hence, hydraulic fluid must be filled via the highest drain port before restart.

-“Shaft horizontal” installation position:

The working lines must not face upward if the installation position is above the reservoir.

Since 2002

Over twenty years of deep cultivation in the field of hydraulic Solutions

HYTEK is a high technology enterprise integrating R&D, production, sales and service of hydraulic power products. Provides professional hydraulic transmission control products and solutions for construction machinery, road machinery, material handling machinery, agricultural and forestry machinery, industrial equipment and other fields. After more than 20 years of continuous R&D, technological innovation, market development and application services, technical level and the scale of production and sales have been on the forefront of the industry. Hytek has been committed to helping the development of subdivided industries with innovative hydraulic technology, "focusing on the challenges and pressures of customers, providing competitive products and solutions, reducing costs and increasing efficiency for customers, and continuously creating maximum value".
