

Axial Piston Variable Pump HA10V(S)O Series 31

Size: 18 mL/r (HA10VSO)
Size: 28-140 mL/r (HA10VO)
Rated pressure: 28 MPa
Max.pressure: 35 MPa

Features

- Axial piston variable pump of swashplate design for open circuits
- Through drive available for multi-circuit systems
- Flow proportional to drive speed and displacement
- Infinitely variable by adjusting angle of swashplate
- Mounting flange according to ISO or SAE standard
- Metric SAE flange connection or UNC fastening thread
- Two case drain ports
- Excellent suction characteristics
- The drive shaft allows axial and radial loading
- High power to weight ratio
- Diverse control options, short control response time

Structure

➤ Hydraulic Fluid

Mineral oil

➤ Working Viscosity

In order for the optimum efficiency and service life, it is recommended to select the working viscosity at working temperature within the range below:

$$V_{\text{opt}} = \text{optimal working viscosity } 16 \dots 36 \text{ mm}^2/\text{s}$$

It is subject to the reservoir temperature of an open circuit.

➤ Limit Viscosity

Limit viscosity:

$$V_{\text{min}} = 10 \text{ mm}^2/\text{s}$$

Short-term operation, at permissible maximum leakage temperature of 90 °C

$$V_{\text{max}} = 1000 \text{ mm}^2/\text{s}$$

Short-term operation, cold start

➤ Temperature Range

$$t_{\text{min}} = -25^\circ\text{C}$$

$$t_{\text{max}} = 90^\circ\text{C}$$

➤ Selection Diagram

➤ Instructions on Selection of Hydraulic Fluid

To select the correct hydraulic fluid, we must know the relationship between the fluid working temperature in the reservoir (open circuit) and the ambient temperature.

The hydraulic fluid should be so selected that the working viscosity in the working range is within the optimum range (V_{opt} , the shaded area on the selection diagram). The higher viscosity is recommended under the same conditions.

For example:

At an ambient temperature of X °C, the working temperature of the circuit is 60 °C. The viscosity within the optimum range (V_{opt} , shaded area) is VG46 or VG68 and the latter should be selected.

Note:

The leakage (case drain) temperature depends on the pressure and speed of the pump, and it is always higher than the reservoir temperature. However, the maximum temperature at any point within the system should not exceed 90 °C.

➤ Filtration

Finer filtration improves the cleanliness level of the hydraulic fluid, thus increasing the service life of the axial piston unit. To ensure normal operation of the axial piston unit, a cleanliness level of at:

NAS 1638,9

ISO/DIS 4406 18/15

Please contact us if the above cleanliness level cannot be reached.

➤ Mechanical Displacement Limiter

The mechanical displacement limiter is available for 12/62N00 series piston pumps without through drive and it realizes free adjustment of maximum displacement between 100% ↔ 50%.

➤ Working Pressure Range

Input

Absolute pressure at port S

P_{abs min} _____ 0.8bar

P_{abs max} _____ 30bar

It determines the decrease in displacement with increase in inlet pressure P_{abs} at port S or rotational speed.

Output

Absolute pressure at port B

P_n _____ 280bar

P_{max} _____ 350bar

The pressure may reach 315 bar at 10% load time during intermittent operation.

➤ Case Drain Pressure

Maximum permissible pressure at drain port (L, L1)

Maximum 0.5 bar higher than inlet pressure at port S

No higher than 2 bar absolute pressure

➤ Flow Direction

From port S to B

Technical Data

Size	Unit			18	28	45	71	100	110	140
Displacement		$V_{g\ max}$	mL/r	18	28	45	71	100	110	140

	Max. speed (continuous) n_{ζ} at increase in inlet pressure P_{abs} and $V_g < V_{g\ max}$	n_{omax}	r/min	3900	3600	3100	2600	2400	2400	2100
Flow	At n_{omax}	$q_{v\ omox}$	L/min	59.4	84	117	156	200	220	252
	At $n_{\zeta}=1500\min^{-1}$		L/min	27	42	68	107	150	165	210
Power $\Delta P=28\text{MPa}$	At n_{omax}	P_{omax}	KW	27.7	39	55	73	93	106	118
	At $n_{\zeta}=1500\min^{-1}$		KW	12.6	20	32	50	70	77	98
Max. torque at $V_{g\ max}(\Delta p=28\text{MPa})$		T_{max}	Nm	80.1	125	200	316	445	507	623
Max. torque at $V_{g\ max}(\Delta p=10\text{MPa})$		T	Nm	28.6	45	72	113	159	176	223
Moment of inertia of drive shaft	J	kgm^2		0.00093	0.0017	0.0033	0.0083	0.0167	0.0167	0.0242
Case volume	L			0.4	0.7	1.0	1.6	2.2	2.2	3.0
Weight	m	kg		12	15	21	33	45	45	60

¹⁾ The above data is valid only when the inlet pressure at port S is 0.1 MPa absolute pressure. The speed may increase as the displacement decreases or the inlet pressure increases.

Specification Calculation

$$\text{Flow} \quad q_v = \frac{V_g \cdot n \cdot \eta_v}{1000}$$

[L/min]

 V_g = Displacement, mL/r Δp = Differential pressure, MPa

$$\text{Torque} \quad T = \frac{V_g \cdot \Delta p}{2 \cdot \pi \cdot \eta_{mh}}$$

[Nm]

 n = Speed, rpm η_v = Volumetric efficiency η_{mh} = Mechanical-hydraulic efficiency

$$\text{Power} \quad P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p}{60 \cdot \eta_t}$$

[KW]

 η_t = Total efficiency

DR-Pressure Control

The pressure controller is used to maintain a constant pressure of the hydraulic system within the control range. As the pump supplies only as much hydraulic fluid as required by the system, the pressure may be continually regulated by the control valve.

Static operating curve($n_1=1500\text{rpm}$, $t_{oil}=50^{\circ}\text{C}$)

Dynamic operating curve

This curve indicates the average measurement in test conditions with the pump installed in the tank.

Working conditions: $n=1500\text{rpm}$
 $t_{oil}=50^{\circ}\text{C}$

Setting of main pressure relief valve 35MPa

Pump loaded with pressure relief valve which is 1m from outlet flange of the pump.

Load step realized by suddenly switching on and off the pressure line.

DRG-Pressure/Remotely Control

DR functions and device
A pressure relief valve may be connected to port X for remote control and the valve is not within the scope of delivery of DRG controller.
The standard differential pressure of the control valve is 2MPa and the required pilot control flow is 1.5L/min.
For other settings (within the range of 1 to 2 MPa), please specify when ordering.

ED-Electro-proportional Remote Pressure Control

The maximum output pressure of the pump depends on the current of the solenoid.

The pump displacement increases to increase the flow and satisfy system requirement if the pump pressure falls below the set pressure. When it reaches the set pressure, the pump will attain the desired flow by regulating its displacement.

The maximum system pressure may be continually adjusted by changing the solenoid current. In reversely proportional control, the pump is in standby state at maximum solenoid current and it has the maximum output pressure at zero current (fail safe function for fan drive). The adjustable hydraulic-mechanical setting at the maximum pressure takes precedence over the current signal.

The maximum output pressure for hydraulic-mechanical setting takes priority over electric signal setting.

Model	ED71	ED72
Working voltage	12V±20%	24V±20%
Start of pressure control p _{max}	100mA	50mA
End of pressure contro p _{min}	1200mA	600mA
Nominal resistance at 20 °C(R ₂₀)	5.5Ω	22.7Ω
Limit current at U _{max}	1.54A	0.77A
Maximum duty cycle	100%	
Temperature range	-20°C to +115°C	
Dither frequency	100-200Hz	
Solenoid material grade	H(T _{max} ≦180°C)	

Resistance calculation equation

at T>20°C $R_w = \frac{R_{20} \times (235+T)}{255}$

Note: Take protective actions as the valve is very hot during operation and immediately after stop!

Static current - pressure characteristic (inversely proportional control)
(measured with pump at zero stroke)

Hysteresis static current-pressure characteristic <3bar

Static operating curve(n=1500min⁻¹, t_{oil}=50°C)

Controller
Standby standard pressure setting 20bar(range 14-22bar)
Hysteresis/pressure increase Δp <4bar

Circuit diagram

B _____ pressure port
S _____ inlet port
L/L1 _____ case drain port (L1 plugged)
Pilot fluid consumption _____ 3-4.5L/min

DFR/DFR1-Pressure/Flow Control

In addition to pressure controller functions, it can also change pump flow by the aid of the differential pressure of a load (e.g. a small hole). The pump supplies only the actual flow of the actuator. For DFR1, there is no connection between port X and the reservoir. For pressure controller functions, see DR control.

Static operating curve($n_1=1500\text{rpm}$, $t_{oil}=50^{\circ}\text{C}$)

Controller time

Size	tSA(ms) at 28MPa	tSE(ms) at 28MPa	tSE(ms) at 5MPa
18	40	15	40
28	40	20	40

71	60	30	60
100	120	60	120
110	120	60	120
140	130	60	130

Controller data

For controller data, see DR control.
Maximum flow deviation measured at drive speed $n=1500\text{rpm}$
(Hysteresis and increase)

Size	18	28	45	71	100	110	140
Δq_{vmax} L/min	0.5	1.0	1.8	2.8	4.0	4.0	6.0

DFR pilot fluid consumption _____ Max.3-4.5L/min
DFR1 pilot fluid consumption _____ Max.3L/min

Differential pressure Δp

Between 1 and 2 MPa (it may be set higher as required).
Standard setting: 1.4MPa. For different settings, please specify when ordering.
Relieving the load on port X to the reservoir results in a zero stroke pressure $P=1.8\pm0.2\text{MPa}$ (standby) (dependent on Δp).

Circuit diagram

Ports
B _____ pressure port
S _____ inlet port
L/L1 _____ case drain port (L1 plugged)
X _____ pilot pressure port

Operating curve at variable speed

Dynamic flow operating curve

This curve indicates the average measurement in test conditions with the pump installed in the tank.

➤ DFLR-Pressure/Flow/Constant Power Control

To obtain a constant drive torque with varying working pressures, the swivel angle and flow of the axial piston pump are varied so that the product of pressure and flow remains constant.
Flow control is possible below the constant power control curve.

Static operating curve

Power characteristic curves are factory set. Please describe in detail in plain text.
For example, 20 kW at 1500 min⁻¹.

Controller data

For technical data of pressure controller, see DR control.
For technical data of flow controller, see DFR/DFR1 control.
start of control _____ from 8MPa
Control fluid consumption _____ Max.5.5L/min
For flow loss at Q_{max}, see drive power and flow page.

Through Drive

HA10VSO pumps are supplied with through drives based on the model code on the through drive classification code page.

The type of through drive is indicated with a code (KB2-K21). A single code is enough if the manufacturer provides no additional pump.

Shipping package includes:

Shaft hub, fastening screws, seals and if necessary, connecting flange.

Combined pump

The combination of several pumps may form independent circuits:

When ordering combination pumps that include HA10VSO and require delivery in assembled state, the two item codes must be joined by a "+".

Order example:

HA10VSO 71 DR/31 L-PPA12KB3 + HA10VSO 28 DR/31 L-PSA12NOO

Max. Permissible Input and Through Drive Torques

Torque distribution between pumps 1 and 2 is optional. The maximum permissible input torque T_{tot} and the maximum permissible through drive torque T_D shall not exceed the specified values.

Installation Dimensions-Through Drive

Flange SAE 127-2(SAE C, 2-hole), for connection of another HA10VSO100 pump (splined shaft S)
Ordering model K24

Flange SAE 152-4(SAE D, 4-hole), for connection of another HA10VSO140 pump (splined shaft S)
Ordering model K17
Main Pump Size HA10VSO140

> Installation Instructions

Any position you prefer.

The pump must be filled with hydraulic fluid during commissioning and operation.

To reduce noise, all connecting lines (inlet line, pressure line and case drain line) must be isolated from the reservoir with flexible components. Do not install any check valve in the case drain line.

You must consult us before implementation in special cases.

> Vertical Installation (drive shaft upwards)

The installation below is for your reference:

a. Inside-reservoir installation

Fill the pump and lay it horizontal before installation.

a) If the minimum fluid level of the reservoir is equal to or higher than the mounting flange surface of the pump, plug port L, and open ports L1 and S; connect pipes to ports L1 and S as shown in FIG. 1.

b) If the minimum fluid level of the reservoir is below the mounting flange surface of the pump, connect pipes to ports L1 and S as shown in FIG. 2.

b. Outside-reservoir installation

Fill the pump before commissioning. See FIG. 2 for above-reservoir installation.

Restriction: Minimum inlet pressure under static and dynamic conditions

$P_{absmin} = 0.8 \text{ bar}$.

Note: Do not install the pump above the reservoir as far as possible to reduce noise.

The permissible suction height h results from the total pressure loss, but it should not exceed $h_{max} = 800 \text{ mm}$ (pipe immersion depth $h_{min} = 200 \text{ mm}$).

Total pressure loss

$$\Delta p_{tot} = \Delta p_1 + \Delta p_2 + \Delta p_3 \leq (1 - P_{absmin}) = 0.2 \text{ bar}$$

Δp_1 : pipe pressure loss from fluid column acceleration

$$\Delta p_1 = \frac{\rho \cdot l \cdot dv}{dt} \cdot 10^{-6} (\text{MPa})$$

Δp_2 : pressure loss from hydrostatic head

$$\Delta p_2 = h \cdot \rho \cdot g \cdot 10^{-6} (\text{MPa})$$

Δp_3 : pipe loss (elbow, etc.)

ρ = viscosity (kg/m^2)

dv/dt = rate of change in fluid velocity (m/s^2)

g = acceleration of gravity = 9.81 m/s^2

l = pipe length (m)

h = height (m)

> Horizontal Installation

For horizontal installation, set port L or L1 on the top.

The installation below is for your reference:

a. Inside-reservoir installation

a) If the minimum fluid level of the reservoir is above the top of the pump, plug port L1; you may open ports L and S, and connect pipes to the two ports (as shown in FIG. 3).

b) If the minimum fluid level of the reservoir is below the top of the pump, plug port L1; see FIG. 4 for pipe connection of port L and possibly port S.

b. Outside-reservoir installation

Fill the pump before commissioning.

Connect pipes to port S and the top port L or L1.

a) See FIG. 4 for above-reservoir installation.

b) Below-reservoir installation

See FIG. 5 for pipe connection of ports L1 and S. Port L is plugged.

Since 2002

Over twenty years of deep cultivation in the field of hydraulic Solutions

HYTEK is a high technology enterprise integrating R&D, production, sales and service of hydraulic power products. Provides professional hydraulic transmission control products and solutions for construction machinery, road machinery, material handling machinery, agricultural and forestry machinery, industrial equipment and other fields. After more than 20 years of continuous R&D, technological innovation, market development and application services, technical level and the scale of production and sales have been on the forefront of the industry. Hytek has been committed to helping the development of subdivided industries with innovative hydraulic technology, "focusing on the challenges and pressures of customers, providing competitive products and solutions, reducing costs and increasing efficiency for customers, and continuously creating maximum value".

Product Series

- Open Circuit Pump
- Closed Circuit Pump
- Fixed Displacement Motor
- Variable Displacement Motor
- Hydrostatic Transmission Unit
- Internal Gear Pump
- Vane Pump
- Proportional valve/
Industrial Hydraulic Valve
